

## Objective::

We wish to provide tracking and usage information for all the devices that get connected to access point,

How we achieved this:

We setup a script on access point that collect information on all connected devices to an access point, This information is uploaded by each access point to Azure cloud storage, Every time a new file is uploaded the azure function triggers and updates tracking table, PowerBi portal uses updated table to display information in graphical way.

## DETAILS:

## Prerequisite

- Azure command line capability installed on access point
  - <https://docs.microsoft.com/en-us/cli/azure/install-azure-cli?view=azure-cli-latest>

## Steps

1. Generate a log file that creates all the devices connected to access point periodically in this case we are calling it every minute using cron command below

```
## crontab -l
*/1 * * * * /root/iot-edge/MyIoTfileupload/Filegenration/mytest/getdevices.sh
---Details here ---
www.adminschoice.com/crontab-quick-reference
```

## Content of getdevices.sh

```
cd /root/iot-edge/MyIoTfileupload/Filegenration/mytest
if cmp -s ./finallog.txt ./backuplog.txt
then
    echo "No new device detected no action needed"
else
    echo "new Device Connection detected Calling script to upload to cloud"
    ./mystorage_upload.sh
fi
# Coping current file to backup as we will generate a new file here
cp ./finallog.txt ./backuplog.txt

# Getting all device connected to AP and storing in log.txt file
arp-scan --interface=wlan0 --localnet | grep "192" >./log.txt

# Comparing the current device connected to last connected devices and creating fianllog.txt with all unique entries
sort ./log.txt ./backuplog.txt | uniq >./finallog.txt

cd /
```

2. Above step will generate a finallog.txt that need to uploaded and has information on all the devices connected in past
  3. Upload finallog.txt to azure blob whenever a new device is detected or this can also be done on periodic basis we are doing it as soon as we get a new device connected as per code in getdevices.sh
- ## Content of mystorage\_upload.sh

```
#!/bin/bash
# A simple Azure Storage example to upload a file
export AZURE_STORAGE_ACCOUNT=<replace with your storage account name>
export AZURE_STORAGE_ACCESS_KEY= <replace with your access key>
export container_name= <Replace with your blob container name>
export file_to_upload=~/.iot-edge/MyIoTfileupload/Filegeneration/mytest/finallog.txt
azure storage blob upload --file $file_to_upload --container $container_name -q
azure storage blob list --container $container_name
```

4. Trigger a function to read the finallog.txt on cloud and generate a table as below

Azure function that reads telemetry finallog.txt and update a table name DeviceDataCap with relevant information

```

1 public static void Run(Stream myBlob, string name, TraceWriter log, ICollector<AccessPoint> output
2 //public static void Run(Stream myBlob, string name, TraceWriter log)
3 {
4     log.Info($"C# Blob trigger function Processed blob\n Name:{name} \n Size: {myBlob.Length} Bytes
5     int count =0;
6     //DateTime today = DateTime.UtcNow.Date;
7     DateTime _now = DateTime.Now;
8     string _dd = _now.ToString("dd"); //
9     string _mm = _now.ToString("MM");
0     string _yy = _now.ToString("yyyy");
1     string _hh = _now.Hour.ToString();
2     string _min = _now.Minute.ToString();
3     string _ss = _now.Second.ToString();
4
5     string _uniqueId= _dd+ _hh+ _mm+_min+_ss + _yy;
6     log.Info(_uniqueId);
7     using (StreamReader reader = new StreamReader(myBlob))
8     {
9         while(!reader.EndOfStream)
0         {
1             {
2                 log.Info(reader.ReadLine());
3                 count++;
4             }
5             log.Info("No fo connected devices are :: "+ count);
6         }
7         outputTable.Add(
8             new AccessPoint(){
9                 //PartitionKey = ""+ Math.Floor(int(DateTime.Today)/24*60*60*1000),
0                 PartitionKey = "Redmond,WA,USA" ,
1                 RowKey = _uniqueId,
2                 NoOfActiveDevices = count}
3         );
4         log.Info("!!!!!!UPdated tracking table !!!!!!!");
5     }
6
7     public class AccessPoint
8     {
9         public string PartitionKey { get; set; }
0         public string RowKey { get; set; }
1         public int NoOfActiveDevices {get; set;}
2     }

```

## Setting for the function trigger and output

Triggers ⓘ
